

These proximity switches are produced as reed switches or electronic switches. Advantage of these switches is that they can be used with all types of Stránský a Petržík's cylinders. It means, that there can be used not only several diameters but also more types of cylinders (VDMA, compact, DIN ISO, etc.) in pneumatic circuit and for all cylinders only one type of switch can be used (it is necessary to select proper bracket for various types of cylinder - see table below). It brings cost savings at designing electrical circuits, at connection as well as at circuit maintaining.

Switch can be used with cylinders with T-slot made by other producers.

How to fix switch on cylinder and which series for which cylinder type

Pneumatic cylinder type	Switch can be used					
	directly	with bracket	with bracket for dovetail groove	With bracket for tube		
				up to Ø25	up to Ø63	up to Ø125
VDMA 24562, CNOMO		✓				
Compact, ISO 15552 (order code 10201...), short stroke Ø160 and 250 mm	✓					
DIN ISO 6432, PDSW, anti-corrosive - hygienic clean				✓

Rotary actuator, Ø 20 to 40 mm				✓	✓	
Rotary actuator, Ø50 and more mm		✓				
With guide unit U or H*		✓		✓	✓	✓

* We recommend to use bracket for tube with cylinder with guide unit, to provide sensing in section, where the guide unit is mounted. The guide body inhibits using of bracket for tie rod / profile. On the other side, or in the area out of guide body, bracket for tie rod / profile can be used.

Warning

Do not exceed specification, permanent damage to the sensor may occur.

Rules for using of proximity switches

- For reed switch type sensors, polarity must also be observed for the proper functioning of LED. Connect the brown wire in series with load positive (+) and the blue wire to negative (-) of power source. If the polarity is reversed, reed switch remains functional but LED will remain in "OFF" state.

- For solid-state type sensors, polarity must also be observed. Connect brown (red for SP-472 switch) wire to the positive (+) and the blue to the negative (-) of DC power source. The black (white for SP-472 switch) wire must connect to the load only. If the black (white for SP-472 switch) wire is accidentally connected to the power source, permanent damage to the sensor may occur.

- An external protection circuit may be required if the reed switch is used with inductive load. For DC voltage, the diode must be connected, for AC voltage, the RC circuit must be connected as shown below.

- Keep sensors away from stray magnetic field to prevent malfunctions.
- When using reed switch with capacitive load or if the lead wire length exceed 10 meters, an inductor must be installed in series.
